

PokeAPI

Provides:

This API provides all the Pokemon data you would ever need.

Key Provisioning:

Pain factor (0=ezy...5=nightmare): 

- No API key needed

Quotas:

- 100 API requests per IP address per minute

The Good:

- Open source (code: <https://github.com/PokeAPI/pokeapi>)
- Documentation is clear and straightforward with examples of JSON results
- Free demos on the website
- Widely used
- API calls are simple
- Allows for searching by id or name
- Allows a limit on the amount of data retrieved. (See **The Bad**)
- JSON is very comprehensive

The Bad:

- There is an issue with the pagination feature (i.e. won't allow getting a specific amount of data from a single request).
 - There is, however, a GitHub issue that provides a solution. (See <https://github.com/PokeAPI/pokeapi/issues/372>)

The Ugly:

- JSON file is hard to look at
